 SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: ELAND E2. THE NUCLEDCAPSID IS A COMPLEX OF PROTEIN C AND MRNA. PTM: THE STRUCTURAL PROTEINS C, ELAND E2 ARE PRODUCED BY PROTECLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES. SIMILLARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39. SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CHARGE RELAY SYSTEM (BY SIMILARITY).

C. FUNCTION: THE SMALL PROPEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

C. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in Pl and Ser or Ala in Pl'.

C. CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                          01-AUG-1992 (Rel. 23, Created)

SUBONIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.

SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A SUBUNIT: THE UNELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                       Vicology 188:331-341(1992).

-1- FUNCTION: THE SWALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC. SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viprecursor polyprotein. commonly with Asp or Glu in the P6 position, Cys or Thr in P and Ser or Ala in P1'.

-1- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate
                                                                                                                                                                                                                   *Full-length sequence of a hepatitis C virus genome having poor homology to reported isolates: comparative study of four distinct
                                                                                                                                                                                                                                                                                                                                                                                                                                -1 - SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

                                                                                                                                                                                                                                                                                                       (RNA)(N).
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polyprotein; Glycoprotein; Transferase; RNA-directed RNA polymerase;

01-APR-1993 (Rel. 25, Last sequence update)
01-APR-1993 (Rel. 25, Last sequence update)
01-APR-1993 (Rel. 42, Last annotation update)
Genome polyprotein (Contains annotation update)
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate Taiwan) (HCV).
Viruses; SSRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chen P.J., Lin M.H., Tai K.F., Liu P.C., Lin C.J., Chen D.S.;

"The Taiwanese hepatitis C virus genome: sequence determination and mapping the 5' termini of viral genomic and antigenomic RNA.";
Virology 188:102-113(1992).

-I- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDOPHORIC. SUGGESTING A POSSIBLE BENERANDE RELATED FUNCTION.

-I- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-I- CATALYTIC ACTIVITY: N nucleoside triphosphate * N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (RNA)(N):
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPMOTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

C. -- TISSUE SPECIFICITY: BRAIN (MOST ABUNDANT IN HIPPOCAMPUS AND AMYSDALA), PLACENTA AND LUNG.
C. -- DISBASE: Defects in FMR2 are the cause of FRAXE [MIM:309548], an x-linked form of mental retardation. Loss of FMR2 expression is correlated with FRAXE CGG(N) expension. Normal individuals have 6-35 copies of the repeat, whereas cytogenetically positive, developmentally delayed males have more than 200 copies and show methylation of the associated CPG island.
-- SIMILARITY: BELONGS TO THE AF4 FAMILY.

Othor T., Mizokami M., Chstopher T., Ohba K., Suzuki K., Roger W.;
"The nucleotide sequence of the core region of HCV in Pakistan and Bangladesh: The geographic characterization of HCV in South Asia.";
Submitted (MAR-1994) to the EMBL/GenBank/DDBJ databases.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MANA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;

"The nucleotide sequence of the core region of HCV in Pakistan and Bangladesh: The geographic characterization of HCV in South Asia.";
Submitted (MAR-1994) to the EMBL/GenBank/DDBJ databases.
--- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN C AND MRNA (BY SIMILARITY).

"Genctype determination of hepatitis C virus from Northern India:
"I dentification of a new subtype.";
I. J. Med. Virol. 48:191-198 (1996).

C. SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSIGNS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MANA (BY SIMILARITY).

-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

Patent No. 6180768
GENERAL INFORMATION:
APPLICANT: STUYVER, LIEVEN
TITLE OF INVENTION: NEW SEQUENCES OF HEPATITIS C VIRUS GENOTYPES
TITLE OF INVENTION: ADD THEIR USE AS PROPHYLACTIC, THERAPEUTIC AND DIAGNOSTIC
NUMBER OF SEQUENCES: 207
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 139; DB 3; Length 28; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 23, Application US/08083947
Patent No. 5639594
GENERAL INFORMATION:
APPLICANT: Wang, Chang Yi
APPLICANT: Hosein, Barbara
TITLE OF INVENTION: No. 5639594el Linear and Branched Peptides Effective
TITLE OF INVENTION: in Diagnosing and Detecting No. 5639594-B Hepat
CORRESPONDENCE ADDRESS:

                                         homologous antigenic poptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosalc protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosalc protein and the artificial mosalc protein are useful for detecting a hepatitis infection in an individual. The mosalc gene and protein is also useful for deceting a hepatitis infection and intendividual. The infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosalc protein improve the sensitivity, spectrum of immunoassays. This provides improved detection of hepatitis C virus. Sequences ANYOGGS-633 represent amino acid sequence of each monomer

This sequence is encoded by the genome of a blood transmissible non-A, non-B hepatitis (NANBH) virus. The CDNA sequence was isolated using the primers given in AAQG3500-35. The amplified fragments are used in the detection of hepatitis virus. The target DNA was isolated from serum of chronically infected NANBH patients who were C100 antibody-positive and HCV RNA (NS5 region) positive. Reverse transcription-PCR and PCR were performed on CDNA and the total human NANBH DNA was constructed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for

artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAY06673-683 represent amino acid sequence of each monomer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to nucleic acid construct which comprises an expression cassette including a first polynucleotide region including a 5 non-coding region (NCR) sequence of an RNA virus, a second polynucleotide region including a 3 untranslated region (UTR) sequence of the RNA virus, a second polynucleotide region including a 3 untranslated region (UTR) sequence of the NNA virus and at least a C-terminal portion of a coding sequence of the virus and at least a C-terminal portion of a coding sequence of the virus and at least a C-terminal portion of a coding sequence of the virus and a third polynucleotide regions; and a promoter sequence being operatively linked to expression cassette in a manner so as to enable a transcription of a minus strand RNA molecule from the expression cassette. Nucleic acid construct of the invention is useful for detecting the presence of an RNA virus in a cell. It is also useful for screening anti-viral drugs and determining drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acid construct useful for detecting the presence of RNA virus, comprises an expression cassette and a promoter operably linked to expression cassette for minus strand RNA transcription of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     resistance of an RNA virus. The present sequence is Hepatitis C virus (HCV) isolate HCV-S1 full-length polyprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        El; envelope 1; core protein; HCV genotyping; antibody; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                DNA and amino acid sequence of HCV envelope 1 and core proteins -used to determine HCV genotype and as vaccines against HCV infection

The vaccine of the invention has virucide, antinflammatory and hepatotropic activity. The attenuated vaccine, and similar nucleic acid vaccines that encode the mutated capsid protein, are useful for protection against a wide range of flavivirus diseases, e.g. pellow fever, Japanese encephalitis, dengue, classical swine fever, bovine viral diarrhoea and chepatitis C. The specified deletion: (i) produces a reliably attenuated virus that does not revert to virulence; (ii) is exactly defined and does not effect immune responses to important proteins; and (iii) can not generate a non-natural virus by recombination. The mutant viruses cellminate the need to produce large amounts of infectious/virulent viruses and can be produced with less expense. The protective response to infever that to killed vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a fragment of the capsid protein from Hepatitis c virus (HCV) type 1 described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Attenuated flavivirus live vaccine, useful for protection against e.g. yellow fever, comprises virus with attenuating deletion of amino acids from the capsid protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HCV; E1; envelope 1; core protein; HCV genotyping; antibody; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel attenuated flavivirus live vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of HCV infection.

                                                                                                                                              The sequences AAR86526-R9657B represent novel sequences isolated from hepatitis C virus subtypes different from subtypes la-c, 2a-d, 3a-f, 4a-f, 5a and 6a. They esp. from the novel subtypes 1d-f, 2e-i, 2k, 2l, 3d, 4k-m, 7a-c or types 9. from the novel subtypes 1d-f, 2e-i, 2k, 2l, 3d, 4k-m, 7a-c or types 9. In or 11. The sequences corresp, to the 5' cuntranslated region (UR), the Core/El, NS4 or NS5 regions of the 5' genome. This sequence represents amino acids 1-317 from the HCV types were isolated from patients with chronic HCV from the Benelux countries, France, Cameroon and Vietnam, because of their abenelux countries, France, Cameroon and Vietnam, because of their abenelux countries, France, Cameroon and Vietnam, because of their abenelux countries, prance, Cameroon and Vietnam, because of their camplified, cloned and genotyped. The 5'UR, Core/El and NSSB regions were sequenced either directly or partially and used to classify the new viruses into (subtypes based on comparison with known sequences. The sequences can also be used to synthesise probes and primars for the sequences can also be used to synthesise probes and primars for the sequences can also be used to synthesise probes and primars for the cantill-HCV antibodies, for HCV typing or to prevent HCV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                    The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 3B and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contained in the capsid protein of the virus and themselves contain epitope groups. These peptides can be used in immunosasys for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific
Synthetic peptide epitope with sequence encoded by hepatitis-C virus - for immunoassay for antigens for diagnosis of non-A,

RESULT 12 AAR30688

```
The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific
                                                                                                                                                                                                                                                                                                                   Synthetic peptide epitope with sequence encoded by hepatitis-C virus - for immunoassay for antigens for diagnosis of non-A, non-B hepatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               non-B hepatitis virus; NANBHV; hepatitis C virus; HCV; SNV; NS1; NS2; NS3; antigen; detection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope artibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific
